

51596 McKenzie Highway  
PO Box 292 (for mail)  
Blue River, OR 97413

(Summarizing our water quality data from 2025)

Blue River Water District strives to provide top quality water to every tap and we are pleased to present you with our annual report. Our goal is to inform and educate you about your water and your utility so we can work together to protect our drinking water sources.

**Where does our water come from?**

We have two wells (one is inactive and only used in emergencies) located near each other that draw from an underground aquifer and pump the water to two storage tanks located on hills at opposite ends of the system. The reservoirs both store water and maintain pressure in the piping system as water use fluctuates throughout the day. A *Source Water Assessment* that evaluates risks to our groundwater was completed by the Oregon Health Authority and Oregon Department of Environmental Quality in February 2001. As part of this study, we learned about the groundwater aquifer that supplies our well. A copy of this report is available upon request.

**How is our water treated? Is our water safe?**

The 2020 Holiday Farm Fire damaged our water system, and we obtained funding to replace all of our piping. Construction has triggered some water quality events. In July 2025 we had a positive total coliform test, and a main line break resulted in a loss of pressure and triggered a boil water notice. After investigation and flushing as needed, both of these were cleared by additional sampling to confirm the water was absent of bacteria. *Our drinking water meets or exceeds all federal and state water quality standards, except for some high levels of copper.* We are investigating ways to reduce the corrosion of copper plumbing causing the high levels, and water service line replacements from our system rebuild are expected to help.

Several samples were not collected on the required schedule. (Results were submitted late after testing on 4/13/2026.) Late samples included: nitrates, radiologicals (combined radium, combined uranium, and gross alpha), synthetic organic compounds, and volatile organic compounds. Only nitrate had a small detection. All results were within the federal limits and we have returned to compliance.

Groundwater stored below the earth receives some natural filtration as it flows through sands and gravels. Our source water is pure enough that we are not required to add chlorine to disinfect and provide protection from bacteria, but this means we have some higher risk of bacterial contamination from a broken pipe or other loss of pressure event. We sample the water at our well and system monitoring points on a regular basis, to look for harmful chemicals or bacteria and verify that the water system is operating properly. Our laboratory data shows that we have good quality water with very few compounds even detected, and all within limits. The Oregon Health Authority inspects water systems every 3-5 years. Our last survey was on July 1, 2025, and we are working to address some late reports and procedural deficiencies that were noted at that time.

**What if I have questions about my water?**

If you have questions about this report or anything else concerning our water system, please call Water Superintendent Jim Parks at 458-459-0048. You can email us at [waterdistrictblueriver@gmail.com](mailto:waterdistrictblueriver@gmail.com) and see the latest news at [www.BlueRiverWaterDistrict.com](http://www.BlueRiverWaterDistrict.com) and you are also invited to attend our monthly board meetings. Blue River contracts with Rainbow Water District (PO Box 8, 1550 N. 42<sup>nd</sup> Street, Springfield 97477) to process our water bills and provide some technical support. If you have a billing or water account question, please call Rainbow Water District at 541-746-1676.

**PFAS in Drinking Water:** The EPA is implementing new drinking water standards for PFAS, the family of chemicals used in a wide variety of non-stick and oil- and water-repellant products. Our system was tested 2/19/26 with no detections. We will continue to sample for PFAS as directed by the EPA or Oregon Health Authority.

## FAQs – Frequently Asked Questions about Blue River’s Water

Q. *Why does my bill increase in the summer?*

A. In addition to our base rate (In June 2025 this rate was \$25.00 per month for residential customers), we charged \$3.50 for every thousand gallons of water used. During the summer you may wash your car, hose off your sidewalks, fill the wading pool or water the lawn and garden. As you use more water during the warmer months, your bill goes up due to the higher usage.

Q. *Can I pay my bill over the phone or internet? Where do I pay?*

A. We accept cash, checks, and money orders. You may pay in person, or send your payment by mail or sign up through our customer portal to pay electronically by credit card, debit card, or ACH withdrawal from your checking account. See the PAY NOW button at [www.rwdonline.net](http://www.rwdonline.net) for more information and to access the customer portal.) Rainbow is located at 1550 N. 42nd Street, Springfield. (Look for the white tanks on 42nd Street, between Olympic and Marcola Road. The driveway is adjacent to the westbound Highway 126 on-ramp.) Rainbow’s office is open 8am-5pm, Monday through Friday. A mail slot on the front of the building may be used for after-hours payments.

Q. *How much should I water my lawn and garden?*

A. Grass needs to have a deep root system to survive and flourish. The amount that is needed depends on the temperature and rate of evaporation. View Rainbow’s website at [www.rwdonline.net/summer-tips](http://www.rwdonline.net/summer-tips) to receive Weekly Watering Recommendations and other helpful information.

Q. *Can I track my water use? How do I know if I have a water leak?*

A. Your meter is by the road, in a box with a lid, and measures the water passing through it to your home. If you look inside, you may flip open the lid on your meter to see a display. The displayed numbers indicate water usage. To check for a leak, make sure you are not using water and read the display. Record the number, wait 15 minutes, then read the digits again. The difference between the two numbers is the quantity of water used in 15 minutes. Any leak on your side of the meter, between the meter and your house, is your responsibility to fix. If it seems there is a leak on the street side of the meter, let us know so we can investigate and take care of any leaks that are our responsibility.

### **Here is what the Environmental Protection Agency (EPA) says about drinking water contaminants:**

All sources of drinking water are subject to potential contamination by substances that are naturally occurring or manmade. These substances can be microbes, inorganic or organic chemicals and radioactive substances. All drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that the water poses a health risk. Drinking water sources (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally occurring minerals and, in some cases, radioactive material, and can pick up substances resulting from the presence of animals or from human activity. Blue River’s water system is supplied entirely by groundwater wells during normal operations. To ensure safe drinking water, the EPA regulates the amount of certain contaminants in water provided by public water systems. The Food and Drug Administration establishes limits for contaminants in bottled water to provide the same protection for public health.

### **Contaminants that may be present in source water may include:**

*Microbial contaminants*, such as viruses and bacteria, may come from wildlife or septic systems. *Radioactive contaminants* can occur naturally. *Inorganic contaminants*, such as salts and metals, can occur naturally or result from urban stormwater runoff, industrial or domestic wastewater discharges or farming. *Organic chemical contaminants*, including synthetic and volatile organic chemicals, are byproducts of industrial processes, and can come from septic systems, gas stations, and urban stormwater runoff. *Pesticides and herbicides* may come from a variety of sources such as farming, urban stormwater runoff and home or business use. Some people may be more vulnerable than others to contaminants in drinking water. Immuno-compromised persons such as organ transplant patients, persons undergoing chemotherapy for cancer, people with HIV/AIDS or other immune system disorders, infants and some elderly, can be particularly at risk from infections. These people should seek advice about drinking water from their personal health care providers. Call 1-800-426-4791 (the Safe Drinking Water Hotline) for EPA & Centers for Disease Control (CDC) guidelines on appropriate means to lessen the risk of infection by Cryptosporidium and other microbiological contaminants, and for more information about water contaminants and their potential health effects.

**A note about lead in the water:** If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is mainly from materials and components associated with service lines and home plumbing. Blue River Water District is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components in your home. You share the responsibility for protecting yourself and your family from the lead in your home plumbing. You can take responsibility by identifying and removing lead materials within your home plumbing and taking steps to reduce your family’s risk. Before drinking tap water, flush your pipes for several minutes by running your tap, taking a shower, doing laundry or a load of dishes. You can also use a filter certified by an American National Standards Institute accredited certifier to reduce lead in drinking water. If you are concerned about lead in your water and wish to have your water tested, contact Rainbow Water at 541-746-1676. Information on lead in drinking water, testing methods, and the steps you can take to minimize exposure is available at [www.epa.gov/safewater/lead](http://www.epa.gov/safewater/lead).

**Service Line Inventory:** The EPA required that Blue River complete a service line inventory, to determine if any lead service lines exist, and submit results by October 2024. As we are preparing to rebuild our entire water system and will have brand new service connections, this report has been postponed and the information will be shared with our customers and regulators once the data is available.

# BLUE RIVER HOMEOWNERS CONSUMER CONFIDENCE REPORT DATA

## TESTING AT WELLFIELD ENTRY POINT "A" TO THE DISTRIBUTION SYSTEM (2025 or most recent results)

Chemical	Category	Source AB Well #2	In Compliance?	Federal Limit*	Federal Goal*	Likely Source of Contamination
Nitrate (as Nitrogen)	Regulated Inorganic	0.408 ppm (7/9/2024) 0.404 ppm (4/13/2026)	Yes	10 ppm	10 ppm	Fertilizer runoff, leaching from septic tanks, sewage, erosion of natural deposits
Inorganic Compounds	Regulated Inorganic	ND except Sodium (1/23/13)	Yes	varies	varies	Erosion of natural deposits
Sodium**	UNREGULATED Inorganic	6.2 ppm (1/23/2013)	Yes	No MCL. 20 ppm is advisory only	n/a	Fertilizer runoff, leaching from septic tanks, sewage, erosion of natural deposits

## TESTING AT ROUTINE DISTRIBUTION SYSTEM LOCATIONS (2025 or most recent results)

Chemical	Contaminant Category	Distribution System Sample Results	In Compliance?	Federal Limit*	Federal Goal*	Likely Source of Contamination
Total Coliform Bacteria	Regulated Microbiological	0.083% positive (1) *** (12 routine samples collected in 2025)	Yes	no more than 1 positive sample per month	0	Naturally present in the environment
Fecal Coliform and E.Coli Bacteria	Regulated Microbiological	0.0% positive (12 routine samples collected in 2025)	Yes	no positive samples	0	Human and animal fecal waste
Chlorine	Disinfectant	System is not chlorinated	Yes	4 ppm	4 ppm	Water additive used to control microbes
Copper (5 samples)	Regulated Inorganics	ND-1.53 (2024) 90th percentile summary is 1.34 ppm	NO 90% > AL	Action Level = 1.3 ppm	0	Corrosion of household plumbing systems
Lead (5 samples)	Regulated Inorganics	ND-3.55 ppb (2024) 90th percentile summary is 2.9 ppb	Yes 90% < AL	Action Level = 15 ppb	0	Corrosion of household plumbing systems, erosion of natural deposits

*There were no 2025 detections of synthetic organic compounds, volatile organic compounds, or radiologicals.*

**Definitions:** **Not Detected (ND)** indicates the contaminant was not detected at levels above the laboratory's reporting capability.

**Action Level (AL)** is the concentration of a contaminant which, if exceeded, triggers treatment or other requirements which a water system must follow.

**Treatment Technique (TT)** is a required process intended to reduce the level of a contaminant in drinking water.

**Maximum Contaminant Level (MCL)** is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology. **Maximum Contaminant Level Goal (MCLG)** is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

**Maximum Residual Disinfectant Level (MRDL)** is the highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants. **Maximum Residual Disinfectant Level Goal (MRDLG)** is the level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.

One **Part Per Million (ppm)** corresponds to one penny in \$10,000 or about one minute in 2 years. Measurements in ppm indicate only one milligram of contaminant per liter of water.

One **Part Per Billion (ppb)** corresponds to one penny in \$10,000,000 or approximately one minute in 2,000 years. It takes 1,000 parts per billion to equal one part per million.

One **Part Per Trillion (ppt)** corresponds to about one second in 32,000 years. It takes 1,000 parts per trillion to equal one part per billion.

**Picocuries Per Liter (pCi/L)** is a measurement of radioactivity, a trillion times smaller than one Curie.

**Running Annual Average (RAA)** is computed using monthly or quarterly results and is a value used to determine compliance.

**Notes** - Some contaminants are monitored less than once per year. Data shown are the most recent monitoring done in compliance with regulations.

*\* Federal Limits may be either the MCL or the MRDL. Federal Goals may be either the MCLG or MRDLG. Maximum contaminant levels (MCLs) are the highest levels of chemicals that the EPA has determined to be acceptable for life-long consumption. MCLs are set at very stringent levels. To understand the possible health effects described for many regulated chemicals, a person would have to drink 2 liters (about 8 glasses) of water every day at the MCL for a lifetime to have a one-in-a-million chance of having the undesirable health effects.*

*\*\* Sodium is not a regulated contaminant, but we show the results of sodium testing for all water sources since some source water contains an amount of sodium which people with high blood pressure may wish to know about.*

*\*\*\* One positive routine sample was collected July 8. Three repeat samples in the distribution system and a triggered source sample from Well 2 were collected July 14-15 and found positive for total coliform only. A Level 1 investigation to determine and/or correct the cause of the contamination was completed on July 16.*
